¹. Rates are per 100,000 population and are age-adjusted by five-year age groups to the 2000 U.S. standard population based on single years of age. Counts and rates are suppressed when fewer than 6 cases were reported for the specific cancer. The suppressed cases, however, are included in the counts and rates for the U.S. combined. Statistics exclude cases diagnosed for AL, LA, MS and TX from July 2005 through December 2005. See Introduction for more information.

². See Technical Notes, Section I, for NAACCR area inclusion criteria for the combined cancer statistics.

³. Selected cancer sites by gender among the U.S. total population and the U.S. Hispanic/Latino population.

⁴. Abbreviations: NH - Non-Hodgkin; IBD - Intrahepatic Bile Duct NOS - Not Otherwise Specified

N.B. In areas with small Latino populations, methods to indirectly identify Latinos (like NHIAv2) can overestimate the ethnicity-specific counts of cancer cases. Also, even small errors in Latino population estimates can affect the magnitude of the cancer rates.
