State cancer registries enable public health professionals to study, understand and address the burden of cancer in a state. Registry data are critical for cancer program activities, cancer control, prevention and treatment. Registries have a lot of data available that can be very useful to many stakeholders.

Present different ways of making cancer data meaningful, interesting and accessible to stakeholders through visual tools.

Explore methods of benchmarking and dashboards for cancer registry data. Review and compare tools available to present cancer data in useful ways.

Disease registries have the ability to make data available in a meaningful way by using tools such as dashboards and score cards and quality reporting. Key components to display are disease registry data reported but also to provide data to reporters.
